DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takagi et al (U.S. 6,243,755) in view of Brandt et al (U.S. 6,377,993).

As per claim 1 Takagi disclosed a method for scheduling harvesting of information by a host computer from one or more information providers for one or more users, comprising the steps of:
(a) for a selected information provider, determining an update time for information stored by the selected information provider (col. 4, lines 52-63); (b) for the selected information provider, determining a set of end users whose information could be modified by an update at the determined update time (col. 5, lines 9-20); (c) generating a predicted login time for each enduser in the determined set of end users (col.3, lines 40-46); (d) sorting determined set of end users according to the predicted login time generated for each end user in the determined set (col. 3, lines 57-67);

However Takagi failed to disclose assigning harvesting time for each end user based on each end user's predicted login time. In the same field of endeavor Brandt disclosed the harvesting process is responsible for performing data validations, filtering, data translations, data grouping, data routing, and data logging functions (col. 19, lines 32-35). The primary object services include: graphical user interface (GUI); communications; printing; user identity, authentication, and

Art Unit: 2141

entitlements; data import and export; logging and statstics; error handling and messaging services (col. 7, lines 30-34).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have incorporated the harvesting time based for each end user based on each end user's predicted login time as taught by Brandt in the method of Takagi to make the network efficient in managing the user's profile.

- 3. As per claim 13 the method disclosed in claim 1 can be consider as consisting of Computer readable storage device.
- 4. As per claim 2 Brandt disclosed the step of determining a set of end users comprises: (i) selecting end users configured to receive information from the selected information provider; (ii) eliminating end users not configured to receive information subject to update at the determined update time (col. 3, lines 48-53).
- 5. As per claim 3 Brandt disclosed wherein the step of determining a set of end users further comprises eliminating end users not meeting a condition of the selected information provider for information update at the determined update time (col. 25, lines 1-27).
- 6. As per claim 4 Brandt disclosed wherein the step of sorting the determined set of endusers comprises sorting the determined set in ascending order of predicted login time (col. 16, lines 60-64).
- 7. As per claim 5 Takagi disclosed wherein the step of generating a predicted login time for each end user in the determined set of end users comprises: (i) for each end user, determining whether a login time profile associated with the end user meets a predetermined confidence threshold (Takagi, col. 15, lines 59-67 & col. 16, lines 1-8); (ii) for each end user whose login time profile does not meet the predetermined confidence threshold, assigning a predicted login time corresponding to the present day and time (Takagi, col. 15, lines 59-67 & col. 16, lines 1-8);

Art Unit: 2141

and (iii) for each end user whose login time profile does meet the predetermined confidence threshold, assigning a predicted login time based on the end user's login time profile (Takagi, col. 15, lines 59-67 & col. 16, lines 1-8). Predetermined confidence threshold consider as reference value in order to allocate different properties to different group.

- 8. As per claim 6, 12 & 15 Takagi disclosed the method of claim 1, and further comprising the step of shifting each end user's predicted login time back a predetermined time interval (col. 13, lines 5-20). Delay can be considered as shifting and user's activity start and end is same as user's login and logout.
- 9. As per claim 7 Takagi disclosed wherein the step of assigning a harvest time comprises assigning a harvest time for each end user corresponding to his shifted login time (col. 12, lines 57-63 & col. 13, lines 5-21).
- 10. As per claim 8 Takagi-Brandt disclosed wherein the step of assigning a harvest time comprises: (i) performing a distribution fit across time to generate a polynomial function that allows determination of the number of end users subject to harvesting over a specified time period (Brandt, col. 19, lines 25-42); (ii) determining a network activity curve of network activity associated with the host computer and the selected information provider (Takagi, col. 27, lines 5-64); In the statistical data can be consider getting data in terms of graphs. (iii) generating an inverse of the determined network activity curve; (iv) performing an integral matching algorithm utilizing the generated polynomial function and the generated inverse of the network activity curve; (Takagi, col. 27, lines 5-64). The statistical calculations involve taking the inverse of the graphs and doing correlations. (v) assigning harvesting times for each end user to redistribute peak harvesting time towards time zero to flatten the distribution fit across time (Brandt, col. 19, lines 25-42).
- 11. As per claim 9, 11 & 14 Brandt disclosed further comprising the step of harvesting the information for each end user in the determined set of end user from the selected information provider at the harvesting time assigned to each end user (col. 19, lines 25-42).

Application/Control Number: 09/427,811

Art Unit: 2141

12. As per claim 10 Takagi-Brandt disclosed a system for scheduling harvesting of information by a host computer from one or more information providers for one or more users, comprising: (a) a user store for storing data associated with end users; (b) a provider store for storing data associated with information providers (Takagi, col. 7, lines 43-67 & col. 8, lines 1-12); and (c) a host computer in communication with the user store and the provider store, the host computer comprising a processor for performing the steps of: (i) for a selected information provider, determining an update time for information stored by the selected information provider based on data associated with the selected information provider in the provider store; (ii) for the selected information provider (Takagi, col. 7, lines 43-67 & col. 8, lines 1-12), determining a set of end users whose information could be modified by an update at the determined update time based on data associated with end users in the user store (Takagi, col. 5, lines 9-20); (iii) generating a predicted login time for each end user in the determined set of end users (Takagi, col.3, lines 40-46); (iv) sorting the determined set of end users according to the predicted login time generated for each end user in the determined set (Takagi, col. 3, lines 57-67); and (v) assigning a harvesting time for each end user based on each end (Brandt, col. 19, lines 25-43).

Applicant arguments are as follows:

13. Applicant argued, "determination of an update time for information stored by a selected information provider and the determination of an end user set based upon the determined update time".

In the prior art Takagi disclosed, some past time can be determined as prescribed period of time (such as an hour) before a scheduled time that is recognized as current time according to the prediction rule. Also some future time is to be determined to contain at least next time zone in which the network can be utilized at low cost (col. 13, lines 7-15). The terminal and the information server changes depending on time and place. In addition depend on activity of the user, there may be long period of time during which terminal is connected to the network (col. 7, lines 36-41).

Application/Control Number: 09/427,811 Page 6

Art Unit: 2141

14. Applicant argued, "sorting step based upon predicted login times for each end user in the determined set".

In the prior art Takagi disclosed Predicting a necessary information will be required by a user using the first information processing apparatus in future and necessary information by which the necessary information which actually required by the user according to a knowledge concerning an activity schedule of the user" (col. 3, lines 52-67) that tends to be one of the functionality of the sorting.

15. Applicant argued, "assignment of harvesting times to end users based upon the end user's predicted login time".

As to applicant's argument Brandt disclosed the harvesting process is responsible for performing data validations filtering, data translations, data grouping, data routing, and data logging functions. Brandt harvesting process supports the data logging functions where one ordinary skill in the art at the time of the invention can interpret data logging function to harvesting login. Brandt also disclosed data harvesting process receives this input on both daily and monthly basis for processing where the term daily and monthly can be related to assigning a harvesting time (col. 19, lines 25-43).

16. Applicant argued that "performing a distribution fit across time to generate a polynomial function that allows determination of the number of end users subject to harvesting over a specified time period".

As to applicant's argument Brandt disclosed harvesting process supports the data routing functions where one ordinary skill in the art at the time of the invention can link data routing functionality using the polynomial mathematical function (col. 19, lines 25-42).

Art Unit: 2141

17. Applicant argued that determining a network activity curve associated with the host computer and the selected information provider, generating an inverse of the determined the network activity curve.

In the prior art Takagi disclosed calculate a correlation by including the past statistical data. Where the past statistical data is linked to the user activity that is on the web that comes under the umbrella of networking (col. 26, lines 54-67). When a correlation exceeds certain value, additional register utilization prediction knowledge, and its triggering condition to the prediction knowledge triggering table (col. 27, lines 15-26).

Applicant's argument not persuasive therefore action is made Final.

Conclusion

18. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
